<b>Preface</b>	xiii
<b>1 Introduction</b>	1
<b>1.1 An overview of the observations</b>	5
• Stars 5    • The Galaxy 11    • Other galaxies 19    ▷ Elliptical galaxies 20    ▷ Spiral galaxies 25    ▷ Lenticular galaxies 28 ▷ Irregular galaxies 28    • Open and globular clusters 29    • Groups and clusters of galaxies 30    • Black holes 32	
<b>1.2 Collisionless systems and the relaxation time</b>	33
• The relaxation time 34	
<b>1.3 The cosmological context</b>	37
• Kinematics 38    • Geometry 39    • Dynamics 40    • The Big Bang and inflation 45    • The cosmic microwave background 48	
<b>Problems</b>	52
<b>2 Potential Theory</b>	55
<b>2.1 General results</b>	56
▷ The potential-energy tensor 59	
<b>2.2 Spherical systems</b>	60
• Newton's theorems 60    ▷ Potential energy of spherical systems 63    • Potentials of some simple systems 63    ▷ Point mass 63    ▷ Homogeneous sphere 63    ▷ Plummer model 65 ▷ Isochrone potential 65    ▷ Modified Hubble model 66 ▷ Power-law density model 68    ▷ Two-power density models 70	
<b>2.3 Potential-density pairs for flattened systems</b>	72
• Kuzmin models and generalizations 72    • Logarithmic potentials 74    • Poisson's equation in very flattened systems 77	
<b>2.4 Multipole expansion</b>	78
<b>2.5 The potentials of spheroidal and ellipsoidal systems</b>	83
• Potentials of spheroidal shells 84    • Potentials of spheroidal systems 87    • Potentials of ellipsoidal systems 94    ▷ Ferrers potentials 95    ▷ Potential-energy tensors of ellipsoidal systems 95	

<b>2.6 The potentials of disks</b>	96				
• Disk potentials from homoeoids 96	▷ The Mestel disk 99	▷ The exponential disk 100	▷ Thick disks 102	• Disk potentials from Bessel functions 103	▷ Application to axisymmetric disks 106
• Disk potentials from logarithmic spirals 107	• Disk potentials from oblate spheroidal coordinates 109				
<b>2.7 The potential of our Galaxy</b>	110				
▷ The bulge 111	▷ The dark halo 112	▷ The stellar disk 112			
▷ The interstellar medium 112	▷ The bulge as a bar 117				
<b>2.8 Potentials from functional expansions</b>	118				
▷ Bi-orthonormal basis functions 120	▷ Designer basis functions 120				
<b>2.9 Poisson solvers for N-body codes</b>	122				
• Direct summation 123	▷ Softening 123	• Tree codes 125			
▷ Cartesian multipole expansion 127	• Particle-mesh codes 129				
▷ Periodic boundary conditions 131	▷ Vacuum boundary conditions 132	▷ Mesh refinement 135	▷ P <sup>3</sup> M codes 135		
• Spherical-harmonic codes 136	• Simulations of planar systems 137				
<b>Problems</b>	137				
<b>3 The Orbits of Stars</b>	142				
<b>3.1 Orbits in static spherical potentials</b>	143				
▷ Spherical harmonic oscillator 147	▷ Kepler potential 147				
▷ Isochrone potential 149	▷ Hyperbolic encounters 153				
• Constants and integrals of the motion 155					
<b>3.2 Orbits in axisymmetric potentials</b>	159				
• Motion in the meridional plane 159	• Surfaces of section 162				
• Nearly circular orbits: epicycles and the velocity ellipsoid 164					
<b>3.3 Orbits in planar non-axisymmetric potentials</b>	171				
• Two-dimensional non-rotating potential 171	• Two-dimensional rotating potential 178	• Weak bars 188			
▷ Lindblad resonances 188	▷ Orbits trapped at resonance 193				
<b>3.4 Numerical orbit integration</b>	196				
• Symplectic integrators 197	▷ Modified Euler integrator 197				
▷ Leapfrog integrator 200	• Runge–Kutta and Bulirsch–Stoer integrators 201	• Multistep predictor-corrector integrators 202			
• Multivalue integrators 203	• Adaptive timesteps 205				
• Individual timesteps 206	• Regularization 208	▷ Burdet–Heggie regularization 208	▷ Kustaanheimo–Stiefel (KS) regularization 210		
<b>3.5 Angle-action variables</b>	211				
• Orbital tori 212	▷ Time-averages theorem 215	▷ Action space 216	▷ Hamilton–Jacobi equation 217	• Angle-action variables for spherical potentials 220	• Angle-action variables for flattened axisymmetric potentials 226
				▷ Stäckel potentials 226	

▷ Epicycle approximation 231	• Angle-action variables for a non-rotating bar 234	• Summary 236	
<b>3.6 Slowly varying potentials</b>			237
• Adiabatic invariance of actions 237	• Applications 238		
▷ Harmonic oscillator 238	▷ Eccentric orbits in a disk 240		
▷ Transient perturbations 240	▷ Slow growth of a central black hole 241		
<b>3.7 Perturbations and chaos</b>			243
• Hamiltonian perturbation theory 243	• Trapping by resonances 246	• From order to chaos 253	
▷ Levitation 250	▷ Irregular orbits 256	▷ Frequency analysis 258	▷ Liapunov exponents 260
<b>3.8 Orbits in elliptical galaxies</b>			262
• The perfect ellipsoid 263	• Dynamical effects of cusps 263		
• Dynamical effects of black holes 266			
<b>Problems</b>			268
<b>4 Equilibria of Collisionless Systems</b>			274
<b>4.1 The collisionless Boltzmann equation</b>			275
• Limitations of the collisionless Boltzmann equation 278	▷ Finite stellar lifetimes 278	▷ Correlations between stars 279	• Relation between the DF and observables 280
	▷ An example 282		
<b>4.2 Jeans theorems</b>			283
• Choice of $f$ and relations between moments 285	▷ DF depending only on $H$ 285	▷ DF depending on $H$ and $L$ 286	
▷ DF depending on $H$ and $L_z$ 286			
<b>4.3 DFs for spherical systems</b>			287
• Ergodic DFs for systems 288	▷ Ergodic Hernquist, Jaffe and isochrone models 290	▷ Differential energy distribution 292	
• DFs for anisotropic spherical systems 293	▷ Models with constant anisotropy 294	▷ Osipkov–Merritt models 297	
▷ Other anisotropic models 298	▷ Differential-energy distribution for anisotropic systems 299	• Spherical systems defined by the DF 299	▷ Polytropes and the Plummer model 300
		▷ Lowered isothermal models 307	
▷ The isothermal sphere 302	▷ Double-power models 311	▷ Michie models 312	
<b>4.4 DFs for axisymmetric density distributions</b>			312
• DF for a given axisymmetric system 312	• Axisymmetric systems specified by $f(H, L_z)$ 314	▷ Fully analytic models 314	
▷ Rowley models 318	▷ Rotation and flattening in spheroids 320		
• The Schwarzschild DF 321			
<b>4.5 DFs for razor-thin disks</b>			329
• Mestel disk 329	• Kalnajs disks 330		
<b>4.6 Using actions as arguments of the DF</b>			333
• Adiabatic compression 335	▷ Cusp around a black hole 336		
▷ Adiabatic deformation of dark matter 337			

<b>4.7 Particle-based and orbit-based models</b>	338
• N-body modeling 339   ▷ Softening 341   ▷ Instability and chaos 341   • Schwarzschild models 344	
<b>4.8 The Jeans and virial equations</b>	347
• Jeans equations for spherical systems 349   ▷ Effect of a central black hole on the observed velocity dispersion 350   • Jeans equations for axisymmetric systems 353   ▷ Asymmetric drift 354 ▷ Spheroidal components with isotropic velocity dispersion 356 • Virial equations 358   ▷ Scalar virial theorem 360 ▷ Spherical systems 361   ▷ The tensor virial theorem and observational data 362	
<b>4.9 Stellar kinematics as a mass detector</b>	365
• Detecting black holes 366   • Extended mass distributions of elliptical galaxies 370   • Dynamics of the solar neighborhood 372	
<b>4.10 The choice of equilibrium</b>	376
• The principle of maximum entropy 377   • Phase mixing and violent relaxation 379   ▷ Phase mixing 379 ▷ Violent relaxation 380   • Numerical simulation of the relaxation process 382	
<b>Problems</b>	387
<b>5 Stability of Collisionless Systems</b>	394
<b>5.1 Introduction</b>	394
• Linear response theory 396   • Linearized equations for stellar and fluid systems 398	
<b>5.2 The response of homogeneous systems</b>	401
• Physical basis of the Jeans instability 401   • Homogeneous systems and the Jeans swindle 401   • The response of a homogeneous fluid system 403   • The response of a homogeneous stellar system 406   ▷ Unstable solutions 410 ▷ Neutrally stable solutions 411   ▷ Damped solutions 412 • Discussion 416	
<b>5.3 General theory of the response of stellar systems</b>	417
• The polarization function in angle-action variables 418   • The Kalnajs matrix method 419   • The response matrix 421	
<b>5.4 The energy principle and secular stability</b>	423
• The energy principle for fluid systems 423   • The energy principle for stellar systems 427   • The relation between the stability of fluid and stellar systems 431	
<b>5.5 The response of spherical systems</b>	432
• The stability of spherical systems with ergodic DFs 432   • The stability of anisotropic spherical systems 433   ▷ Physical basis of the radial-orbit instability 434   • Landau damping and resonances in spherical systems 437	
<b>5.6 The stability of uniformly rotating systems</b>	439
• The uniformly rotating sheet 439   • Kalnajs disks 444 • Maclaurin spheroids and disks 449	

<b>Problems</b>	450
<b>6 Disk Dynamics and Spiral Structure</b>	456
<b>6.1 Fundamentals of spiral structure</b>	458
• Images of spiral galaxies 460     • Spiral arms at other wavelengths 462     ▷ Dust 464     ▷ Relativistic electrons 465	
▷ Molecular gas 465     ▷ Neutral atomic gas 465     ▷ HII regions 467     • The geometry of spiral arms 468     ▷ The strength and number of arms 468     ▷ Leading and trailing arms 469     ▷ The pitch angle and the winding problem 471	
▷ The pattern speed 474     • The anti-spiral theorem 477	
• Angular-momentum transport by spiral-arm torques 478	
<b>6.2 Wave mechanics of differentially rotating disks</b>	481
• Preliminaries 481     ▷ Kinematic density waves 481	
▷ Resonances 484     • The dispersion relation for tightly wound spiral arms 485     ▷ The tight-winding approximation 485	
▷ Potential of a tightly wound spiral pattern 486     ▷ The dispersion relation for fluid disks 488     ▷ The dispersion relation for stellar disks 492     • Local stability of differentially rotating disks 494	
• Long and short waves 497     • Group velocity 499	
• Energy and angular momentum in spiral waves 503	
<b>6.3 Global stability of differentially rotating disks</b>	505
• Numerical work on disk stability 505     • Swing amplifier and feedback loops 508     ▷ The swing amplifier 508	
▷ Feedback loops 512     ▷ Physical interpretation of the bar instability 513     • The maximum-disk hypothesis 515	
• Summary 517	
<b>6.4 Damping and excitation of spiral structure</b>	518
• Response of the interstellar gas to a density wave 518	
• Response of a density wave to the interstellar gas 522	
• Excitation of spiral structure 524     ▷ Excitation by companion galaxies 524     ▷ Excitation by bars 525     ▷ Stationary spiral structure 525     ▷ Excitation of intermediate-scale structure 526	
<b>6.5 Bars</b>	528
• Observations 528     ▷ The pattern speed 531     • Dynamics of bars 533     ▷ Weak bars 534     ▷ Strong bars 535     ▷ The vertical structure of bars 536     ▷ Gas flow in bars 536     ▷ Slow evolution of bars 539	
<b>6.6 Warping and buckling of disks</b>	539
• Warps 539     ▷ Kinematics of warps 540     ▷ Bending waves with self-gravity 542     ▷ The origin of warps 544	
• Buckling instability 548	
<b>Problems</b>	552
<b>7 Kinetic Theory</b>	554
<b>7.1 Relaxation processes</b>	555
▷ Relaxation 555     ▷ Equipartition 556     ▷ Escape 556     ▷ Inelastic	

encounters 557	▷ Binary formation by triple encounters 557	
▷ Interactions with primordial binaries 558		
<b>7.2 General results</b>		559
• Virial theorem 559	• Liouville's theorem 561	• Reduced
distribution functions 563	• Relation of Liouville's equation to	
the collisionless Boltzmann equation 565		
<b>7.3 The thermodynamics of self-gravitating systems</b>		567
• Negative heat capacity 567	• The gravothermal catastrophe 568	
<b>7.4 The Fokker–Planck approximation</b>		573
• The master equation 573	• Fokker–Planck equation 574	
▷ Weak encounters 574	▷ Local encounters 576	▷ Orbit-
▷ Orbit-averaging 577	• Fluctuation-dissipation theorems 578	
• Diffusion coefficients 580	▷ Heating of the Galactic disk by	
MACHOs 583	• Relaxation time 586	• Numerical meth-
• Numerical methods 588	▷ Fluid models 588	ods 588
▷ Monte Carlo methods 592	▷ Monte Carlo methods 592	
▷ Numerical solution of the Fokker–Planck equation 593		
▷ N-body integrations 594	▷ Checks and comparisons 595	
<b>7.5 The evolution of spherical stellar systems</b>		596
• Mass loss from stellar evolution 600	• Evaporation and ejec-	
tion 602	▷ The maximum lifetime of a stellar system 605	• Core
• Core collapse 606	• After core collapse 609	collapse 606
• Equipartition 612	• Equipartition 612	
• Tidal shocks and the survival of globular clusters 615		
• Binary stars 616	▷ Soft binaries 618	▷ Hard binaries 620
▷ Reaction rates 621	• Inelastic encounters 625	• Stellar sys-
▷ Stellar systems with a central black hole 629	▷ Consumption of stars by	tems with a central black hole 629
▷ The effect of a central black hole on the		▷ The effect of a central black hole on the
surrounding stellar system 631		surrounding stellar system 631
<b>7.6 Summary</b>		633
<b>Problems</b>		634
<b>8 Collisions and Encounters of Stellar Systems</b>		639
<b>8.1 Dynamical friction</b>		643
▷ The validity of Chandrasekhar's formula 646	• Applications	
of dynamical friction 647	▷ Decay of black-hole orbits 647	
▷ Galactic cannibalism 649	▷ Orbital decay of the Magellanic	
Clouds 650	▷ Dynamical friction on bars 651	Clouds 650
▷ Formation and	▷ Formation and	
evolution of binary black holes 652	▷ Globular clusters 654	evolution of binary black holes 652
<b>8.2 High-speed encounters</b>		655
▷ Mass loss 657	▷ Return to equilibrium 657	▷ Adiabatic
invariance 658	• The distant-tide approximation 658	invariance 658
• Disruption of stellar systems by high-speed encounters 661		
▷ The catastrophic regime 662	▷ The diffusive regime 663	
▷ Disruption of open clusters 664	▷ Disruption of binary	
stars 665	▷ Dynamical constraints on MACHOs 668	stars 665
▷ Disk and bulge shocks 669	▷ High-speed interactions in clus-	▷ Disk and bulge shocks 669
ters of galaxies 672	ters of galaxies 672	ters of galaxies 672

<b>8.3 Tides</b>	674
• The restricted three-body problem 675    • The sheared-sheet or Hill's approximation 678    ▷ The epicycle approximation and Hill's approximation 679    ▷ The tidal radius in Hill's approximation 680	
• Tidal tails and streamers 681	
<b>8.4 Encounters in stellar disks</b>	685
• Scattering of disk stars by molecular clouds 687    • Scattering of disk stars by spiral arms 691    • Summary 695	
<b>8.5 Mergers</b>	695
• Peculiar galaxies 696    • Grand-design spirals 698	
• Ring galaxies 699    • Shells and other fine structure 701	
• Starbursts 705    • The merger rate 708	
<b>Problems</b>	710
<b>9 Galaxy Formation</b>	716
<b>9.1 Linear structure formation</b>	717
• Gaussian random fields 719    ▷ Filtering 720    ▷ The Harrison-Zeldovich power spectrum 721    • Gravitational instability in the expanding universe 722    ▷ Non-relativistic fluid 722    ▷ Relativistic fluid 726	
<b>9.2 Nonlinear structure formation</b>	733
• Spherical collapse 733    • The cosmic web 735    • Press-Schechter theory 739    ▷ The mass function 744    ▷ The merger rate 746	
• Collapse and virialization in the cosmic web 748	
<b>9.3 N-body simulations of clustering</b>	751
• The mass function of halos 752    • Radial density profiles 753	
• Internal dynamics of halos 756    ▷ The shapes of halos 756	
▷ Rotation of halos 757    ▷ Dynamics of halo substructure 759	
<b>9.4 Star formation and feedback</b>	760
▷ Reionization 760    ▷ Feedback 761    ▷ Mergers, starbursts and quiescent accretion 762    ▷ The role of central black holes 764	
▷ Origin of the galaxy luminosity function 765	
<b>9.5 Conclusions</b>	765
<b>Problems</b>	766

## Appendices

<b>A Useful numbers</b>	770
<b>B Mathematical background</b>	771
• Vectors 771    • Curvilinear coordinate systems 773	
• Vector calculus 775    • Fourier series and transforms 778	
• Abel integral equation 780    • Schwarz's inequality 780	
• Calculus of variations 781    • Poisson distribution 781	
• Conditional probability and Bayes's theorem 782    • Central limit theorem 783	

<b>C Special functions</b>	785
• Delta function and step function 785    • Factorial or gamma function 786    • Error function, Dawson's integral, and plasma dispersion function 786    • Elliptic integrals 787    • Legendre functions 788    • Spherical harmonics 789    • Bessel functions 790	
<b>D Mechanics</b>	792
• Single particles 792    • Systems of particles 794    • Lagrangian dynamics 797    • Hamiltonian dynamics 797    ▷ Hamilton's equations 797    ▷ Poincaré invariants 799    ▷ Poisson brackets 800    ▷ Canonical coordinates and transformations 800    ▷ Extended phase space 803    ▷ Generating functions 803	
<b>E Delaunay variables for Kepler orbits</b>	805
<b>F Fluid mechanics</b>	807
• Basic equations 807    ▷ Continuity equation 807    ▷ Euler's equation 808    ▷ Energy equation 810    ▷ Equation of state 811    • The ideal gas 812    • Sound waves 813    ▷ Energy and momentum in sound waves 814    • Group velocity 817	
<b>G Discrete Fourier transforms</b>	819
<b>H The Antonov–Lebovitz theorem</b>	822
<b>I The Doremus–Feix–Baumann theorem</b>	824
<b>J Angular-momentum transport in disks</b>	826
• Transport in fluid and stellar systems 826    • Transport in a disk with stationary spiral structure 827    • Transport in perturbed axisymmetric disks 828    • Transport in the WKB approximation 829	
<b>K Derivation of the reduction factor</b>	830
<b>L The diffusion coefficients</b>	834
<b>M The distribution of binary energies</b>	838
• The evolution of the energy distribution of binaries 838    • The two-body distribution function in thermal equilibrium 839    • The distribution of binary energies in thermal equilibrium 839    • The principle of detailed balance 841	
<b>References</b>	842
